

Automatic results filtering (syntax comparison) ? X

Go through the currently displayed list of hypotheses, and:

every hypothesis that is

<input type="checkbox"/> syntactically the same	<input type="checkbox"/> most specific (most literals)	<input checked="" type="checkbox"/> most wide (longest coefs)
<input type="checkbox"/> syntactically different	<input type="checkbox"/> most general (fewest literals)	<input type="checkbox"/> most narrow (shortest coefs)

compared to any/all hypothesis in any of the lists checked below:

currently displayed list of hypotheses

group of hypotheses:

hypotheses of another task:

move into

new group of hypotheses: Syntax match group

already existing group:
